Meeting assets for Kayleigh Anderson-Natale's Personal Meeting Room are ready!

Meeting summary

Quick recap

The meeting focused on discussing the development of a data compilation and querying tool for Kayleigh's graduate division events. Kayleigh explained that she needs a system to combine attendance and registration data from multiple events into a single dataset that can be queried for reporting purposes, as currently she compiles data manually into Excel spreadsheets which limits her ability to analyze multi-year data or generate specific reports. The team discussed three potential deployment options: local development on Kayleigh's computer, integration with UCI's OIT servers, or cloud hosting, with local development being the most feasible approach for the 10-week project timeline. Kayleigh clarified that the project scope no longer includes automating the reconciliation between registration and attendance data, as this is already handled by student employees, but instead focuses on creating a querying system that allows her to generate reports and pull specific student information for outreach purposes. The team explored potential query capabilities, including the ability to filter by student major, event type, and attendance patterns, with Kayleigh expressing interest in both numerical data and contact information extraction for email campaigns.

Next steps

Kayleigh

- Create and provide additional dummy registration data that does not perfectly match attendance data to support the potential automation of the reconciliation process.
- Have Karen double-check that the dummy 1220 data files exactly match the original platform's format, including headers, punctuation, and spacing.
- Upload the meeting notes from today's session to the Google folder.

Collaboration

- Brandon, Molly, Jennifer, Eric: Develop a prototype/proof of concept that runs locally on Kayleigh's computer, allowing for the upload of 1220 (Excel) and Campus Groups (CSV) data into a compiled dataset that can be queried.
- Brandon, Molly, Jennifer, Eric: Research and determine the best approach for the querying functionality, including the possibility of an AI-powered chatbot or a SQL-like interface.
- Brandon, Molly, Jennifer, Eric: Discuss internally whether to include the reconciliation process (comparing registration vs. attendance) in the MVP, given Kayleigh's openness to the value but lack of immediate pressure.
- Brandon, Molly, Jennifer, Eric: Determine the implementation of authentication/login for the local tool to ensure data privacy.

Summary

Local Prototype Development Planning

Kayleigh discussed adding a folder in Google for meeting notes and shared dummy data due to student privacy concerns. The team aligned on developing a prototype that runs locally on one computer rather than using cloud hosting or UCI servers, as the local approach best fits the 10-week project timeline. Kayleigh expressed interest in potentially working with UCI OIT to integrate the tool on university servers after the project concludes.

Student Attendance Data Workflow Process

Kayleigh clarified the data workflow process, explaining that student attendance data is already compiled into spreadsheets from both campus groups and 1220 systems, with one spreadsheet per event. She clarified that Molly's team should focus on working with the existing compiled data rather than the Google sign-in forms, as the reconciliation of attendance with registration would already be completed by student employees. Kayleigh confirmed that the data would be in both Excel and CSV formats, and explained that the goal is to upload these files into a system to compile a dataset that can be queried to answer specific questions.

Event Attendance Data Compilation

Kayleigh explained that the project focuses on compiling event attendance data into a queryable dataset rather than automating the reconciliation process between registration and attendance. The team will work with 1220 data files and campus group data files to create a consolidated Excel spreadsheet that can be queried for specific information like attendance at particular events. Kayleigh noted that while automated reconciliation was discussed, it was not a priority for this project, as student employees currently handle that process.

Attendance Data Management Platform Discussion

Kayleigh discussed challenges with using Excel to manage and query attendance data across multiple terms, noting limitations in filtering and consolidating data across years due to file size constraints. She explained her need to extract specific insights, such as tracking attendance by department or identifying unique students, to generate reports for her dean. Brandon and Molly explored the possibility of creating a unified platform that could automate data processing, support drag-and-drop functionality for raw spreadsheets, and generate reports while allowing for data querying. Kayleigh expressed interest in such a platform, combining both automation for student assistants and enhanced querying capabilities for her needs.

Student Activities Platform Development Discussion

Brandon and Kayleigh discussed creating a single platform for student activities, with Kayleigh offering to provide registration dummy data generated using AI to help with the development process. They confirmed that the 1220 data files should maintain the same headers and formatting as the original platform downloads, with no changes to punctuations or spacing. Kayleigh also explained her interest in implementing different querying capabilities, potentially using SQL, to allow for both detailed student lists and aggregate data analysis.

Data Access and AI Implementation

The team discussed potential ways to access and utilize data, including the possibility of implementing an AI chatbot to handle queries directly. Jennifer mentioned considering this option but noted the need for further research to avoid over-committing. Kayleigh provided an example of a functional use case for the data, involving pulling contact information for specific student groups to compile email lists. The conversation ended with Jennifer mentioning an assignment requirement to demonstrate value to their sponsor and suggesting others discuss the MOV.

Graduate Division Tool Implementation Discussion

The team discussed the value and time implications of a new tool being developed for the graduate division. Kayleigh explained that while the tool might not significantly reduce data retrieval time, it would enhance reporting capabilities and data flexibility, allowing for more effective communication with leadership about student engagement and identifying gaps in program accessibility. The discussion focused on establishing measurable goals for the tool's implementation, particularly regarding how it could help track and report student attendance data across different programs and demographics.

Data Reconciliation System Implementation

Kayleigh clarified that the reconciliation task with registration and attendance data does not present cost savings opportunities, as student employees are already needed for front desk duties. She explained that the system should store data permanently to build a comprehensive dataset that could be accessed for historical analysis, though the current implementation uses dummy data for proof of concept purposes. The team discussed authentication requirements, with Kayleigh indicating that while login functionality would be needed for real data, the current local implementation might not require complex multi-user authentication.

Attendees: Kayleigh Anderson-Natale (Organizer), Eric Song, Brandon (External), Molly Tran (External), Jennifer (External)
