Meeting assets for Kayleigh Anderson-Natale's Personal Meeting Room are ready!

Meeting summary

Quick recap

The meeting focused on the GPSRC's process for collecting and managing event attendance data from Campus Groups and 1220. Rosie explained that Campus Groups automatically captures NetID, while 1220 relies on email addresses, which are usually equivalent to NetIDs. She described how student assistants use iPad check-ins to mark attendance on these platforms and then copy that data into a large master spreadsheet. Kayleigh highlighted the need for a tool to reconcile incomplete records, handle blank columns, and generate reports by criteria like school or program. The team discussed the importance of using NetID for FERPA compliance and the desire for a dashboard with exportable Excel outputs. They also touched on hosting options, such as AWS versus a local tool, and the need for a centralized database. Brandon and Eric asked clarifying questions about data identifiers, the manual reconciliation process, and the format of the exported CSV files.

Next steps

Eric

- Research and provide an estimate for the cost of hosting the tool on AWS.

Kayleigh

- Talk to the department and OIT team to get information on hosting preferences and best practices for similar tools.

Collaboration

- Karen and Rosie: Pull raw CSV exports from Campus Groups and 1220 and upload them to the Google folder.
- Karen and Rosie: Add a few additional rows of sample data to the templates for the team to work with, anonymizing emails if necessary.
- Eric and Brandon: Review the templates and data in the Google folder and prepare follow-up questions for the next meeting.

Summary

Data Collection Platform Differences

Rosie explained the differences in data collection between Campus Groups and 1220 platforms, noting that Campus Groups automatically collects first name, last name, email, student ID, and net ID, while 1220 lacks net ID but includes graduation term information. Kayleigh mentioned their goal

to eventually link this event data with the broader department data using NetID to pull additional information like student status and international/domestic classification. The team discussed challenges in connecting data across platforms, particularly when manually adding attendees to events where they haven't RSVP'd, which results in losing detailed information except for basic contact details.

Event Attendance Tracking Process Review

Rosie explained the current process for tracking event attendance at GPSRC, where student assistants collect check-in data from in-person events and input it into spreadsheets that are later compiled into a comprehensive annual report. Kayleigh identified the main challenges as inconsistent data and difficulty connecting student records, requesting a system that can handle incomplete data and generate detailed reports. The team agreed that the first week would focus on reviewing existing templates and understanding the current process, with further discussion planned for the following week to determine next steps.

Registration Data Reconciliation Tool Discussion

Kayleigh discussed the need for a tool to reconcile registration data from Canvas Group or 1220 platforms with attendance records from iPad check-ins. She explained that while compliance is not the primary concern, using net IDs instead of student IDs helps avoid FERPA violations. The main purpose would be to create comprehensive reports for demonstrating their work to others, particularly mentioning a recent request from a new dean for data on programming from the past year.

Student Event Attendance Reporting System

The team discussed the need for reporting functionality to track student attendance at events, with a focus on being able to filter and sort data by school, program, and other criteria. Kayleigh and Karen explained they wanted both dashboard filtering capabilities and the ability to download the filtered data to Excel or CSV files for further analysis. The team clarified that the output should allow users to view and download specific student data, such as all Biological Sciences students who attended particular events.

Event Registration Identifier Requirements

The team discussed identifier requirements for event registration systems, focusing on how to track participants across different platforms including 1220, Campus Groups, and Google forms. They clarified that NetIDs are automatically generated for 1220 registrations and connected to Campus Group records through email addresses, though student ID numbers entered manually are less reliable due to students often not knowing their IDs. The discussion concluded with Eric asking about hosting options for a web application, presenting choices between AWS hosting and a local tool, though the decision was left unresolved.

Data Tool Hosting Options Discussion

The team discussed hosting options for a data tool, with Kayleigh expressing uncertainty about local hosting capabilities and Eric explaining that running it locally would be specific to individual computers. They agreed to research AWS hosting costs and compliance requirements, with Kayleigh planning to consult with her department's data and OIT teams. The group also clarified the current event attendance process, where student assistants manually match iPad check-in data with campus group registrations, and Brandon requested sample CSV files and additional data rows for testing purposes.

Attendees: Kayleigh Anderson-Natale (Organizer), Rosie Victor, Brandon Lau, Karen Friedlander,

Eric Song (External)
